When the micro-organisms, which normally digest organic matter become inactive, mud accumulates, causing algae and blanketweed to thrive on the over nutrition. <strong>AQUAPLANCTON</strong> reactivates these beneficial bacteria which then multiply and consume the mud. This starves algae and blanketweed of nutrition, causing them to die out naturally. Good bacteria, working well, can consume up to 15cm (6") of mud in 6 months.<br /><br />For cost-effective elimination of sludge, slime algae, and odour, and to get back your crystal clear ponds through the biological digestion of organic mud, click on this <a href="http://www.aquaplancton.co.uk/index.php" target="\_blank" title="remove blanketweed">remove blanketweed</a> link. </p>
